The clone sequenced to the left is RP11-32P22, 200 bp overlap; the clone sequenced to the right is RP11-122E16. Actual start of this clone is at base position 149634 of RP11-32P22; actual end is at base position 136868 of RP11-422A6. The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanase, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pleter de Jong and coworkers at the Roswell Park Cancer Institute This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. Center code: WIBR Center: Whitehead Institute/ MIT Center for Genome Research

* NOTE: This record contains 61 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will 677 776: gap of 676: contig of 676 bp in length

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the genture table with their source databases: Em:, EMBL; Sw:, SWISEPROT; TY:, TREMIL; Mp:, WORMPEP; Information on the WORMPEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IMPORTANT: This sequence is not the entire insert of clone RP11-592B10 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-411F9 is at 47873 in this sequence. The true right end of clone RP5-1007B16 is at 100 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC upstream of the uridine diphosphate glucuronosyltransferase (UGT) gene CC 1*1 exon 1 (see AAT79540), and was used to amplify fragments of 233-255 CC bp. This gene is known to be associated with Gilbert's syndrome (GS). GS CC is a mild, common form of unconjugated hyperbilirubinaemia associated CC with reduced bilirubin glucuronidation capacity. Analysis of the genetic CC basis of GS has allowed 2 forms to be identified. One is a mild form CC associated with a homozygous 2 bp insertion in the TAPA sequence CC upstream of the UGT1*1 exon 1, and the other is a more severe form CC cassociated with heterozygosity for a mutation which, when homozygous, CC causes Crigler-Najjar type 2 disease. The first form is autosomal CC cassociated with second is inherited dominantly. Patients suffering from CC GS, which is benign, may have altered metabolism of some drugs, making it CC difficult to determine if an effect is due to the drug or the syndrome. CC Urig trial efficiency would be improved if potential participants can be compared for the genetic basis of GS, and eliminated or included on basis of them possessing or not possessing GS.

                          CC gene 1:1 exon: 1. This gene is known to be associated with Glibert's gene 1:1 exon: 1. This gene is known to be associated with Glibert's CC syndrome (GS). GS is a mild, common form of unconjugated CC hyperbilirubinaemia associated with reduced bilirubin glucuronidation (CC capacity. Analysis of the genetic basis of GS has allowed 2 forms to be identified. One is a mild form associated with a homozygous 2 bp insertion in the TATA sequence upstream of the UGI1*1 exon 1, and CC the other is a more severe form associated with heterozygosity for a CC mutation which, when homozygous, causes Crigler-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from GS, which is benign, may have altered metabilism of some drugs, making it difficult to determine if an CC effect is due to the drug or the syndrome. Drug trial efficiency would CC be improved if potential participants can be screened for the genetic CC basis of GS, and eliminated or included on basis of temp possessing or not possessing GS. In this case, screening involves PCR amplification CC of the UGI gene, using the primers described in AAT79541-44.
                                                                                                                                                                                                                                                                                                                                                             improving drug trial efficiency comprises identifying participants
with Gilbert's syndrome - useful as their altered drug metabolism
may hinder result interpretation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TATA_signal

                                                                                                                                                                                                                                    haemochromatosis (HFE) gene mutation in an individual comprising:

(a) providing DNA or RNA from the individual; and (b) assessing the presence or absence of absence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk correction butyrophilin (BT), and can be used in the production of agonists and antagonists of BT function. Also described are: (1) a Roket gene which can be used to develop products for the study, diagnosis and can treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can can similarly be used for hypophosphatemia.
                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g X
                                                                                                                                                                                                                                                                                                                            The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA ilbraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                        Matches
                                                                                                                                                                                                         Query Match

```
The present sequence encodes in endo-beta-mannanase enzyme, which is involved in the hydrolysis of polysaccharides that consist of molecules of mannan, either simple or branched, linked together by beta (1-4) bonds. The mannanase polysucleotide sequence is used for in vivo modification of the coffee endo-beta-mannanase gene. It is also used to produce transgenic plant cells (especially coffee cells) which have modified properties of mannan polysaccharide, and thus altered flavour or structure. The enzyme is used for modification, degradation or synthesis of mannan polysaccharides in vitro, particularly to treat coffee beans to increase the percentage of dry matter extraction, and thus reduce the quantity of sediment.

cc assays, predictive medicine and therapeutic and prophylatic methods of treatment. The methods may be used to diagnose and treat patients which cc are suffering from a disorder associated with abnormal level or rate of capptotic cell death, abnormal activity of the Fas/ARO-1 receptor complex, abnormal activity of the TNF receptor complex, or abnormal concerns activity of a caspase. Diseases that may be treated include cancer cc (particularly follicular lymphoma, carcinomas associated with mutations cc in p53 and hormone-dependent tumours), autoimmune disorders (e.g. viral systemic lupus crythematosis, immune-mediated glomerulonephritis), viral csystemic lupus crythematosis, immune-mediated glomerulonephritis), viral csystemic lupus crythematosis, immune-mediated glomerulonephritis, viral capaceastion, anaemia, myelodysplastic syndrome, myocardial infarction, cc degeneration, anaemia, myelodysplastic syndrome, myocardial infarction, cc and stroke. CARD-3 protein interacts with other cellular proteins, and so cc and cell survival. The CARD proteins may also be used to for screen drugs or compounds which modulate their activity. The CARD-4 gene can express a clong transcript that encodes CARD-41, a short transcript that encodes cCARD-45 or two CARD-4 splice variants, CARD-47 and CARD-42. This sequence cc represents a genomic DNA sequence which encodes the human CARD-4 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes the isolation of novel human caspase recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins and partial murine CARD-4L protein and genes. The genes and proteins of the invention are involved in the regulation of caspase activation. The caspase recruitment domain (CARD) polynucleotides, polypeptides, homologues and antibodies can be used in screening assays, detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel CARD-3 and CARD-4 genes and polypeptides used or treating regulation of cellular proliferation and differentiation and cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-FEB-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of the human caspase recruitment domain 4 (CARD-4) gene on chromosome 7. CARD-4 exists in at least 4 forms, i.e. the long form CARD-41 (see AAB20081), the short form CARD-42 (see AAB20081), and splice variants CARD-47 (see AAB20082) and CARD-42 (see AAB20082). It is an intracellular protein predicted to be involved in regulating caspase activation. It activates the NF-kappaB pathway and enhances caspase 9-mediated cell death. Methods of diagnosing and treating patients suffering cell death. Methods of diagnosing and treating patients suffering cell death, abnormal activity of the Fas/APO-1 receptor complex, abnormal activity of the tumour necrosis factor receptor complex or abnormal activity of a caspase involve administering a compound that modulates the expression or activity of CARD-3, CARD-4, CARD-5 or CARD-6 e.g. a small molecule, antisense nucleic acid, ribozyme car polymentide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches 18;

phage clones were converted to the pBluescript SK(-) recombinant plasmid by in vive excision. The recombinant expression of these rare OMP's can be used for diagnostic tests to detect syphilis and for development of host immunity during syphilis. This 957 bp sequence (TROMP1 gene) encodes a precursor rare outer membrane protein (OMP) of species Treponema pallidum, subspecies pallidum. The TROMP1 gene was cloned in a procedure where mixed oligonucleotides (31-A,31-C) hybridized to a EcoR1 restriction fragment by Southern blot analysis of T. pallidum genomic DNA. DNA fragments were excised from the agarose egt, purified and ligated into the lambda ZAP II vector and probed with 31-A and 31-C. The

New genes encoding proteins involved in a plant polysaccharide biosynthetic pathway, useful for modulating or altering the polysaccharide content, composition or structure of the plant

Claim 1; Page 140; 301pp; English.

The present invention describes isolated polynucleotides (PN) comprising a sequence selected from one of 835 nucleotide sequences given in AAA67073 to AAA67907, their (reverse) complements, sequences producing an Expectation (E) value of 0.01 or less compared to the 835 sequences, compared to the 835 sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences at least 50% identical to them, 200, 100, 40 or 20 mers of the 835 sequences or sequences that are degenerately equivalent or allelic to the 835 sequences. The polynucleotides are used to modify the activity of a polypeptide involved in a polysaccharide blosynthetic pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are proteins encoded by some of the polynucleotide sequence given in the present invention.
                                                                                                         Calpain is a human leukodyte derived calcium dependent cysteine protease. Calpain can be used to screen for compounds that activate or inhibit its proteolytic activity. Calpain DNA can be used to treat or prevent cancer, cerebral apoplexy, cerebral infarction, subarachnoid haemorrhage, Alzheimer's disease, myodystrophy, cataracts, ischaemic heart disease, atherosclerosis, arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Calpain; human; leukocyte; calcium dependent cysteine protease; screening; activator; inhibitor; treatment; prevention; cancer; cerebral apoplexy; cerebral infarction; subarachnoid haemorrhage; Alzheimer's disease; myodystrophy; cataracts; collagen disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 537 BP; 155 A; 119 C; 136 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human calpain small subunit cDNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        27-APR-1998
                                                                Sequence 640
                                                                                                                                                                                                    The present sequence is a calpain small subunit cDNA fragment.
                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                Human calpain protein and related DNA - useful for drug screening and treating cancer, stroke, etc.
                                                                                                                                                                                                                                                                                                                                                                           (TAKE ) TAKEDA CHEM IND LTD.

CC hAAC7567 to AAC78448 encode the human cancer associated proteins given CC in AAB4398 to AAB44239. The proteins can have activities based on the CC tissues and cells the genes are expressed in. Example of activities can include: cytostatic; proliferative; vulnerary; immunomodulator; cantidiabetic; antiasthmatic; antirheumatic; antibacterial; antiviral; cc antidiabetic; antiasthmatic; antirheumatic; antibacterial; antiviral; cc antidiabetic; antiasthmatic; antirheumatic; antibacterial; antiviral; cc polynucleotides; neuroprotective; cardiant; thrombolytic; coagulant; cc polynucleotides and polypeptides can be used for preventing, treating or cc ameliorating medical conditions and diagnosing pathological conditions. C polynucleotides, polypeptides, antibodies, agonists and antagonists from ct proventing the proliferation, differentiation or mobilisation of the present invention may be used to treat immune disorders by activating cor inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune cc disorders, altergic reactions, graft versus host disease and organ crejection, modulate haemostatic or thrombolytic activity, modulate information, cancers, cardiovascular disorders, neurological disease and cc antibates and antagonists may be also be used in drug screens. AAC78449 to calcondate the present invention of the present provention of the present invention of the present invention of the processor invention of the present

New human signal peptide-containing proteins useful in treatment, prevention and diagnosis of e.g. cancer, inflammation and cardiovascular disease

Claim 9; Page 257-258; 327pp; English.

ARZSULT 15
ARZSULT 15
ARZSULT AZ SAL cc be used in gene therapy. HSPP can be used to treat or prevent disorders of activity or function of HSPP. Antagonists of continuing or the continuing or function of HSPP. Antagonists of cativity or function of HSPP. Such diseases include cell proliferation continuing cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders, (e.g. arteriosclerosis, corribosis, poorissis, acquired immune deficiency syndrome, anaemia, asthma, crohn's disease, microbial or other infections, congestive or diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP concleit acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diseases, schizophrenia, ovulationy defects, muscular dystrophy). HSPP concleit acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diseases, schizophrenia, ovulation and amplification assays (for chiplex-forming or ribozyme therapeutics, for detecting related sequences triplex-forming or ribozyme therapeutics, for detecting related sequences cor genetic varietions, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and contain therapeutic agents), Ab are used to diagnose, or monitor, HSPP-related diseases (in usual immunoassays), as therapeutic AAZ98109 to AAZ98242 encode AAY87224 to AAY87357 which represent the human signal peptide containing proteins HSP-1 to HSP-134. HSPPs have anti-cancer, anti-inflammatory, anti-inflammatory, and inflammatory, and anticorphial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotide kinase. Adaptor oilgonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114(gblAF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
